

Home Appliance Comparison & Buying Guide Platform

Problem Statement

Choosing the right home appliance has become difficult because customers have to compare many products from different brands, stores, and online platforms. Appliances such as refrigerators, washing machines, air conditioners, televisions, microwave ovens, and vacuum cleaners differ in price, features, energy efficiency, capacity, warranty, customer ratings, and after-sales service. The large amount of information available online can make the purchasing process confusing and time-consuming, especially for users who do not have technical knowledge about appliance specifications.

Many existing shopping platforms mainly focus on displaying products and prices, but they may not provide a simple and comprehensive comparison based on the user's actual needs. Customers often have to visit multiple websites, manually collect specifications, check reviews, and calculate whether a product provides good value for money. This can lead to poor purchasing decisions, unnecessary expenses, and difficulty identifying the most suitable appliance.

The proposed Home Appliance Comparison & Buying Guide Platform aims to solve this problem by providing a centralized system where users can search, compare, filter, and evaluate home appliances in one place. The platform will present important product information such as price, specifications, energy rating, features, warranty, ratings, reviews, and estimated value for money. Users will be able to compare multiple appliances side by side and receive buying guidance according to their budget, requirements, and preferences.

The system can also provide intelligent recommendations by considering factors such as budget, appliance type, capacity, energy efficiency, preferred brand, required features, and customer ratings. By reducing the need for manual research and presenting information in an easy-to-understand format, the platform can help customers make faster, more informed, and cost-effective purchasing decisions.

Objective

The main objective of the platform is to create a user-friendly and reliable appliance comparison and buying-guide system that simplifies product research, provides transparent comparisons, and helps customers select the most suitable home appliance based on their individual needs and budget.
